1 Introduction

Generate Bode, Nyquist, and Nichols plots for transfer functions in the canonical (TF) form

$$G(s) = e^{-Ts} \frac{b_m s^m + \dots + b_1 s + b_0}{a_n s^n + \dots + a_1 s + a_0}$$
(1)

and the zero-pole-gain (ZPK) form

$$G(s) = Ke^{-T_s} \frac{(s-z_1)(s-z_2)\cdots(s-z_m)}{(s-p_1)(s-p_2)\cdots(s-p_n)}.$$
 (2)

In the equations above, b_m, \dots, b_0 and a_n, \dots, a_0 are real coefficients, $T \geq 0$ is the loop delay, z_1, \dots, z_m and p_1, \dots, p_n are complex zeros and poles of the transfer function, respectively, and $K \in \Re$ is the loop gain. For transfer functions in the ZPK format in (2) with zero delay, this package also supports linear and asymptotic approximation of Bode plots. **Limitation:** in TF form, the phase angles are always between 0 and 360°, As such, the Bode phase plots and the Nyquist and Nichols plots will have phase wrapping discontinuities. I do not know how this can be rectified, pull requests are welcome!

2 Usage

2.1 Bode plots

\BodeZPK

Plots the Bode plot of a transfer function given in ZPK format using the groupplot environment. The three mandatory arguments include: (1) a list of tuples, comprised of the zeros, the poles, the gain, and the transport delay of the transfer function, (2) the lower end of the frequency range for the x- axis, and (3) the higher end of the frequency range for the x-axis. The zeros and the poles are complex numbers, entered as a comma-separated list of comma-separated lists, of the form {{real part 1,imaginary part 1}, {real part 2,imaginary part 2},...}. If the imaginary part is not provided, it is assumed to be zero.

The optional argument is comprised of a comma separated list of tuples, either obj/typ/{opt}, or obj/{opt}, or just {opt}. Each tuple passes options to different pgfplots macros that generate the group, the axes, and the plots according to:

- Tuples of the form obj/typ/{opt}:
 - plot/typ/{opt}: modify plot properties by adding options {opt} to the \addplot macro for the magnitude plot if typ is mag and the phase plot if typ is ph.

- axes/typ/{opt}: modify axis properties by adding options {opt} to
 the \nextgroupplot macro for the magnitude plot if typ is mag and
 the phase plot if typ is ph.
- commands/typ/{opt}: add any valid TikZ commands (including the the parametric function generator macros in this package, such as \addBodeZPKPlots, \addBodeTFPlot, and \addBodeComponentPlot) to the magnitude axes plot if typ is mag and the phase plot if typ is ph. The commands passed to opt need to be valid TikZ commands, separated by semicolons as usual. For example, a TikZ command is used in the description of the \BodeTF macro below to mark the gain crossover frequency on the Bode Magnitude plot.
- Tuples of the form obj/{opt}:
 - plot/{opt}: adds options {opt} to \addplot macros for both the magnitude and the phase plots.
 - axes/{opt}: adds options {opt} to \nextgroupplot macros for both the magnitude and the phase plots.
 - group/{opt}: adds options {opt} to the groupplot environment.
 - tikz/{opt}: adds options {opt} to the tikzpicture environment.
 - approx/linear: plots linear approximation.
 - approx/asymptotic: plots asymptotic approximation.
- Tuples of the form {opts} add all of the supplied options to \addplot macros for both the magnitude and the phase plots.

The options {opt} can be any key=value options that are supported by the pgfplots macros they are added to. Linear or asymptotic approximation of transfer functions that include a transport delay is not supported.

For example, given a transfer function

$$G(s) = 10 \frac{s(s + 0.1 + 0.5i)(s + 0.1 - 0.5i)}{(s + 0.5 + 10i)(s + 0.5 - 10i)},$$
(3)

its Bode plot over the frequency range [0.01,100] can be generated using \BodeZPK [blue,thick]

$${z/{0,\{-0.1,-0.5\},\{-0.1,0.5\}\},p/{\{-0.5,-10\},\{-0.5,10\}\},k/10\}}}$$

which generates the plot in Figure 1. If a delay is not specified, it is assumed to be zero. If a gain is not specified, it is assumed to be 1. By default, each of the axes, excluding ticks and labels, are 5cm wide and 2.5cm high. The width and the height, along with other properties of the plots, the axes, and the group can be customized using native pgf keys as shown in the example below.

As demonstrated in this example, if a single comma-separated list of options is passed, it applies to both the magnitude and the phase plots. Without any optional arguments, we gets a thick black Bode plot.

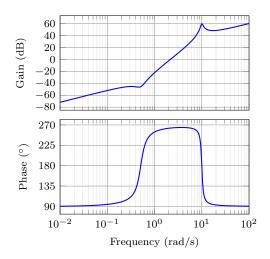

Figure 1: Output of the default \BodeZPK macro.

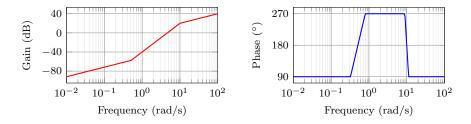

Figure 2: Customization of the default \BodeZPK macro.

A linear approximation of the Bode plot with customization of the plots, the axes, and the group can be generated using
\BodeZPK[plot/mag/{red,thick},plot/ph/{blue,thick},
 axes/mag/{ytick distance=40,xmajorticks=true,
 xlabel={Frequency (rad/s)}},axes/ph/{ytick distance=90},
 group/{group style={group size=2 by 1,horizontal sep=2cm,
 width=4cm,height=2cm}},approx/linear]
 {z/{0,{-0.1,-0.5},{-0.1,0.5}},p/{{-0.5,-10},{-0.5,10}},k/10}
 {0.01}{100}

which generates the plot in Figure 2.

\BodeTF

\BodeTF $[\langle obj1/typ1/\{\langle opt1\rangle\}, obj2/typ2/\{\langle opt2\rangle\},...\rangle]$ $\{\langle num/\{\langle coeffs\rangle\}, den/\{\langle coeffs\rangle\}, d/\{\langle delay\rangle\}\}\}$ $\{\langle min-freq\rangle\}\{\langle max-freq\rangle\}$

Plots the Bode plot of a transfer function given in TF format. The three mandatory arguments include: (1) a list of tuples comprised of the coefficients in the

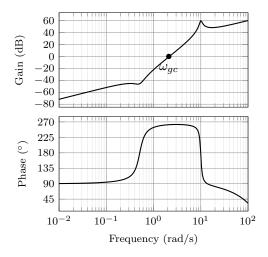

Figure 3: Output of the \BodeTF macro with an optional TikZ command used to mark the gain crossover frequency.

numerator and the denominator of the transfer function and the transport delay, (2) the lower end of the frequency range for the x-axis, and (3) the higher end of the frequency range for the x-axis. The coefficients are entered as a commaseparated list, in order from the highest degree of s to the lowest, with zeros for missing degrees. The optional arguments are the same as \BodeZPK , except that linear/asymptotic approximation is not supported, so \BodeZPK ... is ignored.

For example, given the same transfer function as (3) in TF form and with a small transport delay,

$$G(s) = e^{-0.01s} \frac{s(10s^2 + 2s + 2.6)}{(s^2 + s + 100.25)},$$
(4)

its Bode plot over the frequency range [0.01,100] can be generated using \BodeTF[commands/mag/{\node at (axis cs: 2.1,0)

[circle,fill,inner sep=0.05cm,label=below: $\{\infty,0\},0$, $\{0,0\},0$, $\{1,0,2,100\},0$, $\{0,0\},0$, $\{1,0,2\},0$,

which generates the plot in Figure 3. Note the 0 added to the numerator coefficients to account for the fact that the numerator does not have a constant term in it. Note the semicolon after the TikZ command passed to the \commands option.

BodePlot

```
\begin{BodePlot} [\langle obj1/\{\langle opt1\rangle\}, obj2/\{\langle opt2\rangle\}, ...\rangle] \\ \{\langle min\text{-}frequency\rangle\} \{\langle max\text{-}frequency\rangle\} \\ \addBode... \\ \begin{BodePlot} \end{BodePlot} \end{BodePlot} \\ \begin{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \\ \begin{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \\ \begin{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \\ \begin{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \\ \begin{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \end{BodePlot} \\ \end{BodePlot} \end{BodePlot} \end{BodePlot} \\ \end{BodePlot} \end{BodePl
```

The BodePlot environment works in conjunction with the parametric function generator macros \addBodeZPKPlots, \addBodeTFPlot, and \addBodeComponentPlot.

The optional argument is comprised of a comma separated list of tuples, either obj/{opt} or just {opt}. Each tuple passes options to different pgfplots macros that generate the axes and the plots according to:

- Tuples of the form obj/{opt}:
 - tikz/{opt}: modify picture properties by adding options {opt} to the tikzpicture environment.
 - axes/{opt}: modify axis properties by adding options {opt} to the semilogaxis environment.
 - commands/{opt}: add any valid TikZ commands inside semilogaxis environment. The commands passed to opt need to be valid TikZ commands, separated by semicolons as usual.
- Tuples of the form {opt} are passed directly to the semilogaxis environment.

The frequency limits are translated to the x-axis limits and the domain of the semilogaxis environment. Example usage in the description of \addBodeZPKPlots, \addBodeTFPlot, and \addBodeComponentPlot.

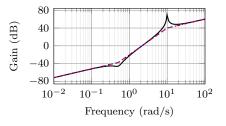

\addBodeZPKPlots

```
\label{eq:local_approx1} $$ \addBodeZPKPlots $$ [\langle approx1/\{\langle opt1\rangle\}, approx2/\{\langle opt2\rangle\},...\rangle] $$ $$ \{\langle plot-type\rangle\} $$ $$ $\{\langle z/\{\langle zeros\rangle\}, p/\{\langle poles\rangle\}, k/\{\langle gain\rangle\}, d/\{\langle delay\rangle\}\}\}$$
```

Generates the appropriate parametric functions and supplies them to multiple \addplot macros, one for each approx/{opt} pair in the optional argument. If no optional argument is supplied, then a single \addplot command corresponding to a thick true Bode plot is generated. If an optional argument is supplied, it needs to be one of true/{opt}, linear/{opt}, or asymptotic/{opt}. This macro can be used inside any semilogaxis environment as long as a domain for the x-axis is supplied through either the approx/{opt} interface or directly in the optional argument of the semilogaxis environment. Use with the BodePlot environment supplied with this package is recommended. The second mandatory argument, plot-type is either magnitude or phase. If it is not equal to phase, it is assumed to be magnitude. The last mandatory argument is the same as \BodeZPK.

For example, given the transfer function in (3), its linear, asymptotic, and true Bode plots can be superimposed using

```
\begin{BodePlot}[ ylabel={Gain (dB)}, ytick distance=40,
  height=2cm, width=4cm] {0.01} {100}
\addBodeZPKPlots[
  true/{black,thick},
  linear/{red,dashed,thick},
  asymptotic/{blue,dotted,thick}]
  {magnitude}
  {z/{0,{-0.1,-0.5},{-0.1,0.5}},p/{{-0.1,-10},{-0.1,10}},k/10}
\end{BodePlot}
\begin{BodePlot}[ylabel={Phase ($^{\circ}$)},
```

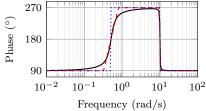

Figure 4: Superimposed approximate and true Bode plots using the BodePlot environment and the \addBodeZPKPlots macro.

```
height=2cm, width=4cm, ytick distance=90] {0.01} {100}
\addBodeZPKPlots[
   true/{black,thick},
   linear/{red,dashed,thick},
   asymptotic/{blue,dotted,thick}]
   {phase}
   {z/{0,{-0.1,-0.5},{-0.1,0.5}},p/{{-0.1,-10},{-0.1,10}},k/10}
\end{BodePlot}
```

\addBodeTFPlot

which generates the plot in Figure 4. $\label{eq:continuous} $$ \addBodeTFPlot[\langle plot-options \rangle] $$ $ \{\langle plot-type \rangle\} $$ $ \{\langle num/\{\langle coeffs \rangle\}, den/\{\langle coeffs \rangle\}, d/\{\langle delay \rangle\} \} $$$

Generates a single parametric function for either Bode magnitude or phase plot of a transfer function in TF form. The generated parametric function is passed to the \addplot macro. This macro can be used inside any semilogaxis environment as long as a domain for the x-axis is supplied through either the plot-options interface or directly in the optional argument of the container semilogaxis environment. Use with the BodePlot environment supplied with this package is recommended. The second mandatory argument, plot-type is either magnitude or phase. If it is not equal to phase, it is assumed to be magnitude. The last mandatory argument is the same as \BodeTF.

\addBodeComponentPlot

 $\verb|\addBodeComponentPlot[|\langle plot-options\rangle|] \{|\langle plot-command\rangle|\}|$

Generates a single parametric function corresponding to the mandatory argument plot-command and passes it to the \addplot macro. The plot command can be any parametric function that uses t as the independent variable. The parametric function must be gnuplot compatible (or pgfplots compatible if the package is loaded using the pgf option). The intended use of this macro is to plot the parametric functions generated using the basic component macros described in Section 2.1.1 below.

2.1.1 Basic components up to first order

\TypeFeatureApprox

 $\label{thm:continuous} $$\operatorname{TypeFeatureApprox}_{\langle real-part\rangle}_{\langle imaginary-part\rangle}$$

This entry describes 20 different macros of the form \TypeFeatureApprox that take the real part and the imaginary part of a complex number as arguments. The Type in the macro name should be replaced by either Mag or Ph to generate a parametric function corresponding to the magnitude or the phase plot, respectively. The Feature in the macro name should be replaced by one of K, Pole, Zero, or Del, to generate the Bode plot of a gain, a complex pole, a complex zero, or a transport delay, respectively. If the Feature is set to either K or Del, the imaginary-part mandatory argument is ignored. The Approx in the macro name should either be removed, or it should be replaced by Lin or Asymp to generate the true Bode plot, the linear approximation, or the asymptotic approximation, respectively. If the Feature is set to Del, then Approx has to be removed. For example,

- \MagK{k}{0} or \MagK{k}{400} generates a parametric function for the true Bode magnitude of G(s)=k
- \PhPoleLin{a}{b} generates a parametric function for the linear approximation of the Bode phase of $G(s) = \frac{1}{s-a-\mathrm{i}b}$.
- \PhDel{T}{200} or \PhDel{T}{0} generates a parametric function for the Bode phase of $G(s)=e^{-Ts}$.

All 20 of the macros defined by combinations of Type, Feature, and Approx, and any gnuplot (or pgfplot if the pgf class option is loaded) compatible function of the 20 macros can be used as plot-command in the addBodeComponentPlot macro. This is sufficient to generate the Bode plot of any rational transfer function with delay. For example, the Bode phase plot in Figure 4 can also be generated using:

```
\begin{BodePlot}[ylabel={Phase (degree)},ytick distance=90]{0.01}{100}
\addBodeComponentPlot[black,thick]{\PhZero{0}{0} + \PhZero{-0.1}{-0.5} +
\PhZero{-0.1}{0.5} + \PhPole{-0.5}{-10} + \PhPole{-0.5}{10} +
\PhK{10}{0}}
\addBodeComponentPlot[red,dashed,thick] {\PhZeroLin{0}{0} +
\PhZeroLin{-0.1}{-0.5} + \PhZeroLin{-0.1}{0.5} +
\PhPoleLin{-0.5}{-10} + \PhPoleLin{-0.5}{10} + \PhKLin{10}{20}}
\addBodeComponentPlot[blue,dotted,thick] {\PhZeroAsymp{0}{0} +
\PhZeroAsymp{-0.1}{-0.5} + \PhZeroAsymp{-0.1}{0.5} +
\PhPoleAsymp{-0.5}{-10} + \PhPoleAsymp{-0.5}{10} + \PhKAsymp{10}{40}}
\end{BodePlot}
```

which gives us the plot in Figure 5.

2.1.2 Basic components of the second order

\TypeSOFeatureApprox

```
TypeSOFeatureApprox{\langle a1 \rangle}{\langle a0 \rangle}
```

This entry describes 12 different macros of the form \TypeSOFeatureApprox that take the coefficients a_1 and a_0 of a general second order system as inputs. The Feature in the macro name should be replaced by either Poles or Zeros to generate the Bode plot of $G(s) = \frac{1}{s^2 + a_1 s + a_0}$ or $G(s) = s^2 + a_1 s + a_0$, respectively. The

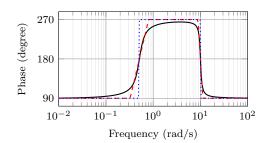

Figure 5: Superimposed approximate and true Bode Phase plot using the BodePlot environment, the \addBodeComponentPlot macro, and several macros of the \TypeFeatureApprox form.

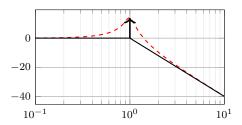

Figure 6: Resonant peak in asymptotic Bode plot using \MagSOPolesPeak.

Type in the macro name should be replaced by either Mag or Ph to generate a parametric function corresponding to the magnitude or the phase plot, respectively. The Approx in the macro name should either be removed, or it should be replaced by Lin or Asymp to generate the true Bode plot, the linear approximation, or the asymptotic approximation, respectively.

\MagSOFeaturePeak

 $\verb|\MagSOFeaturePeak[| \langle draw-options \rangle] {\langle a1 \rangle} {\langle a0 \rangle}$

This entry describes 2 different macros of the form $\mbox{MagS0FeaturePeak}$ that take the the coefficients a_1 and a_0 of a general second order system as inputs, and draw a resonant peak using the \mbox{draw} TikZ macro. The Feature in the macro name should be replaced by either Poles or Zeros to generate a peak for poles and a valley for zeros, respectively. For example, the command

```
\begin{BodePlot}[xlabel={}]{0.1}{10}
\addBodeComponentPlot[red,dashed,thick]{\MagSOPoles{0.2}{1}}
\addBodeComponentPlot[black,thick]{\MagSOPolesLin{0.2}{1}}
\MagSOPolesPeak[thick]{0.2}{1}
\end{BodePlot}
```

\TypeCSFeatureApprox

generates the plot in Figure 6.

 $TypeCSFeatureApprox{\langle zeta \rangle}{\langle omega-n \rangle}$

This entry describes 12 different macros of the form \TypeCSFeatureApprox that

take the damping ratio, ζ , and the natural frequency, ω_n of a canonical second order system as inputs. The Type in the macro name should be replaced by either Mag or Ph to generate a parametric function corresponding to the magnitude or the phase plot, respectively. The Feature in the macro name should be replaced by either Poles or Zeros to generate the Bode plot of $G(s) = \frac{1}{s^2 + 2\zeta\omega_n s + \omega_n^2}$ or $G(s) = s^2 + 2\zeta\omega_n s + \omega_n^2$, respectively. The Approx in the macro name should either be removed, or it should be replaced by Lin or Asymp to generate the true Bode plot, the linear approximation, or the asymptotic approximation, respectively.

\MagCSFeaturePeak

 $\verb|\MagCSFeaturePeak| [\langle draw-options \rangle] {\langle zeta \rangle} {\langle omega-n \rangle}$

This entry describes 2 different macros of the form $\mbox{MagCSFeaturePeak}$ that take the damping ratio, ζ , and the natural frequency, ω_n of a canonical second order system as inputs, and draw a resonant peak using the \mbox{draw} TikZ macro. The Feature in the macro name should be replaced by either Poles or Zeros to generate a peak for poles and a valley for zeros, respectively.

\MagCCFeaturePeak

 $\mbox{MagCCFeaturePeak}[\mbox{$\langle traw-options \rangle]} {\mbox{$\langle traginary-part \rangle$}}$ This entry describes 2 different macros of the form $\mbox{$\langle the real and imaginary parts}$ of a pair of complex conjugate poles or zeros as inputs, and draw a resonant peak using the <math>\mbox{$\langle the draw TikZ macro.}$$ The Feature in the macro name should be replaced by either Poles or Zeros to generate a peak for poles and a valley for zeros, respectively.

2.2 Nyquist plots

\NyquistZPK

```
\label{eq:local_system} $$ \begin{aligned} & \  |\langle plot/\{\langle opt\rangle\}, axes/\{\langle opt\rangle\}\}| \\ & \  \{\langle z/\{\langle zeros\rangle\}, p/\{\langle poles\rangle\}, k/\{\langle gain\rangle\}, d/\{\langle delay\rangle\}\}\} \\ & \  \{\langle min-freq\rangle\} \{\langle max-freq\rangle\} \end{aligned}
```

Plots the Nyquist plot of a transfer function given in ZPK format with a thick red + marking the critical point (-1,0). The mandatory arguments are the same as \BodeZPK. Since there is only one plot in a Nyquist diagram, the \typ specifier in the optional argument tuples is not needed. As such, the supported optional argument tuples are plot/{opt}, which passes {opt} to \addplot, axes/{opt}, which passes {\opt} to the axis environment, and tikz/{opt}, which passes {\opt} to the tikzpicture environment. Asymptotic/linear approximations are not supported in Nyquist plots. If just {opt} is provided as the optional argument, it is interpreted as plot/{opt}. Arrows to indicate the direction of increasing ω can be added by adding \usetikzlibrary{decorations.markings} and \usetikzlibrary{arrows.meta} to the preamble and then passing a tuple of the form

```
plot/{postaction=decorate,decoration={markings,
  mark=between positions 0.1 and 0.9 step 5em with
  {\arrow{Stealth [length=2mm, blue]}}}}
```

Caution: with a high number of samples, adding arrows in this way may cause the error message! Dimension too big.

For example, the command \NyquistZPK[plot/{red,thick,samples=2000},axes/{blue,thick}]

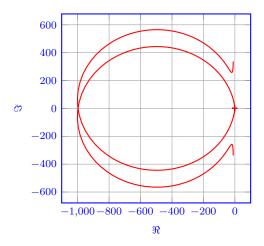

Figure 7: Output of the \NyquistZPK macro.

```
{z/{0, \{-0.1, -0.5\}, \{-0.1, 0.5\}\}, p/{\{-0.5, -10\}, \{-0.5, 10\}\}, k/10\}}}
                   {-30}{30}
                 generates the Nyquist plot in Figure 7.
 \NyquistTF
                     \NyquistTF [\langle plot/\{\langle opt \rangle\}, axes/\{\langle opt \rangle\} \rangle]
                      \{\langle num/\{\langle coeffs \rangle\}, den/\{\langle coeffs \rangle\}, d/\{\langle delay \rangle\}\}\}
                      \{\langle min\text{-}freq \rangle\}\{\langle max\text{-}freq \rangle\}
                 Nyquist plot of a transfer function given in TF format. Same mandatory argu-
                 ments as \BodeTF and same optional arguments as \NyquistZPK. For example,
                 the command
                 \NyquistTF[plot/{green,thick,samples=500,postaction=decorate,
                   decoration={markings,
                   mark=between positions 0.1 and 0.9 step 5em
                   with{\arrow{Stealth[length=2mm, blue]}}}]
                    \{num/\{10,2,2.6,0\},den/\{1,1,100.25\}\}
                    {-30}{30}
                 generates the Nyquist plot in Figure 8.
                     \begin{NyquistPlot} [\langle obj1/\{\langle opt1\rangle\}, obj2/\{\langle opt2\rangle\},...\rangle]
NyquistPlot
                         {\langle min\text{-}frequency \rangle} {\langle max\text{-}frequency \rangle}
                      \addNyquist...
                     \end{NyquistPlot}
                 The NyquistPlot environment works in conjunction with the parametric function
```

The NyquistPlot environment works in conjunction with the parametric function generator macros \addNyquistZPKPlot and \addNyquistTFPlot. The optional argument is comprised of a comma separated list of tuples, either obj/{opt} or just {opt}. Each tuple passes options to different pgfplots macros that generate the axes and the plots according to:

• Tuples of the form obj/{opt}:

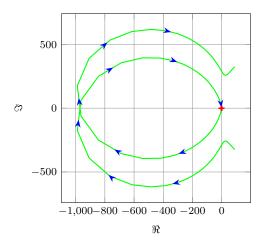

Figure 8: Output of the \NyquistTF macro with direction arrows. Increasing the number of samples can cause decorations.markings to throw errors.

- tikz/{opt}: modify picture properties by adding options {opt} to the tikzpicture environment.
- axes/{opt}: modify axis properties by adding options {opt} to the axis environment.
- commands/{opt}: add any valid TikZ commands inside axis environment. The commands passed to opt need to be valid TikZ commands, separated by semicolons as usual.
- Tuples of the form {opt} are passed directly to the axis environment.

The frequency limits are translated to the x-axis limits and the domain of the axis environment.

\addNyquistZPKPlot

```
\label{eq:local_local_problem} $$ \addNyquistZPKPlot[\langle plot-options\rangle] $$ $ \{\langle z/\{\langle zeros\rangle\}, p/\{\langle poles\rangle\}, k/\{\langle gain\rangle\}, d/\{\langle delay\rangle\}\}\}$$
```

Generates a twp parametric functions for the magnitude and the phase a transfer function in ZPK form. The generated magnitude and phase parametric functions are converted to real and imaginary part parametric functions and passed to the \addplot macro. This macro can be used inside any axis environment as long as a domain for the x-axis is supplied through either the plot-options interface or directly in the optional argument of the container axis environment. Use with the NyquistPlot environment supplied with this package is recommended. The mandatory argument is the same as \BodeZPK.

\addNyquistTFPlot

```
\addNyquistTFPlot[\langle plot-options \rangle]
```

 $\{\langle num/\{\langle coeffs \rangle\}, den/\{\langle coeffs \rangle\}, d/\{\langle delay \rangle\}\}\}$

Similar to \addNyquistZPKPlot, with a transfer function input in the TF form.

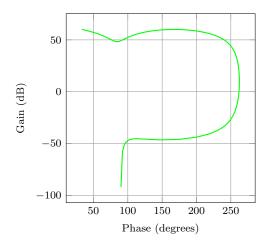

Figure 9: Output of the \NyquistZPK macro.

2.3 Nichols charts

```
\NicholsZPK
                      \NicholsZPK [\langle plot/\{\langle opt \rangle\}, axes/\{\langle opt \rangle\}\}]
                             \{\langle z/\{\langle zeros \rangle\}, p/\{\langle poles \rangle\}, k/\{\langle gain \rangle\}, d/\{\langle delay \rangle\}\}\}
                             \{\langle min\text{-}freq \rangle\}\{\langle max\text{-}freq \rangle\}
                      Nichols chart of a transfer function given in ZPK format. Same arguments as
                      \NyquistZPK.
                           \NicholsTF [\langle plot/f\langle opt \rangle J, axes/f\langle opt \rangle J \rangle]
   \NicholsTF
                             \{\langle num/\{\langle coeffs \rangle\}, den/\{\langle coeffs \rangle\}, d/\{\langle delay \rangle\}\}\}
                             \{\langle min\text{-}freq \rangle\}\{\langle max\text{-}freq \rangle\}
                      Nichols chart of a transfer function given in TF format. Same arguments as
                      \NyquistTF. For example, the command
                      \NicholsTF[plot/{green,thick,samples=2000}]
                          \{num/\{10,2,2.6,0\},den/\{1,1,100.25\},d/0.01\}
                         {0.001}{100}
                      generates the Nichols chart in Figure 9.
                           \begin{NicholsChart} [\langle obj1/\{\langle opt1\rangle\}, obj2/\{\langle opt2\rangle\},...\rangle]
NicholsChart
                                {\langle min\text{-}frequency \rangle} {\langle max\text{-}frequency \rangle}
                             \addNichols...
                           \end{NicholsChart}
```

The NicholsChart environment works in conjunction with the parametric function generator macros \addNicholsZPKChart and \addNicholsTFChart. The optional argument is comprised of a comma separated list of tuples, either obj/{opt} or just {opt}. Each tuple passes options to different pgfplots macros that generate the axes and the plots according to:

• Tuples of the form obj/{opt}:

- tikz/{opt}: modify picture properties by adding options {opt} to the tikzpicture environment.
- axes/{opt}: modify axis properties by adding options {opt} to the axis environment.
- commands/{opt}: add any valid TikZ commands inside axis environment. The commands passed to opt need to be valid TikZ commands, separated by semicolons as usual.
- Tuples of the form {opt} are passed directly to the axis environment.

The frequency limits are translated to the x-axis limits and the domain of the axis environment.

\addNicholsZPKChart

```
\label{localizero} $$ \addNicholsZPKChart[\langle plot-options\rangle] $$ \{\langle z/\{\langle zeros\rangle\}, p/\{\langle poles\rangle\}, k/\{\langle gain\rangle\}, d/\{\langle delay\rangle\}\}\}$$
```

Generates a twp parametric functions for the magnitude and the phase a transfer function in ZPK form. The generated magnitude and phase parametric functions are passed to the \addplot macro. This macro can be used inside any axis environment as long as a domain for the x-axis is supplied through either the plot-options interface or directly in the optional argument of the container axis environment. Use with the NicholsChart environment supplied with this package is recommended. The mandatory argument is the same as \BodeZPK.

\addNicholsTFChart

```
\label{eq:local_local_state} $$ \addNicholsTFChart[\langle plot-options \rangle] $$ $ \{\langle num/\{\langle coeffs \rangle\}, den/\{\langle coeffs \rangle\}, d/\{\langle delay \rangle\} \}$$
```

Similar to \addNicholsZPKChart, with a transfer function input in the TF form.

3 Implementation

3.1 Initialization

\pdfstrcmp

The package makes extensive use of the \pdfstrcmp macro to parse options. Since that macro is not available in lualatex, this code is needed.

```
1 \RequirePackage{ifluatex}%
2 \ifluatex
3 \let\pdfstrcmp\pdf@strcmp
```

\n@mod \n@pow This code is needed to support both pgfplots and gnuplot simultaneously. New macros are defined for the pow and mod functions to address differences between the two math engines. We start by processing the pgf class option.

gnuplot@id
gnuplot@prefix
gnuplot@degrees

```
5 \newif\if@pgfarg\@pgfargfalse
6 \DeclareOption{pgf}{%
```

7 \@pgfargtrue

8 }

9 \ProcessOptions\relax

Then, we define two new macros to unify pgfplots and gnuplot.

10 \if@pgfarg

```
11  \newcommand{\n@pow}[2]{(#1)^(#2)}%
12  \newcommand{\n@mod}[2]{mod((#1),(#2))}%
13 \else
14  \newcommand{\n@pow}[2]{(#1)**(#2)}%
15  \newcommand{\n@mod}[2]{(#1)-(floor((#1)/(#2))*(#2))}%
```

Then, we create a counter so that a new data table is generated and for each new plot. If the plot macros have not changed, the tables, once generated, can be reused by gnuplot, which reduces compilation time.

```
16 \newcounter{gnuplot@id}%
17 \setcounter{gnuplot@id}{0}%
18 \tikzset{%
19 gnuplot@prefix/.style={%
20 id=\arabic{gnuplot@id},
21 prefix=gnuplot/\jobname
22 }%
23 }
```

Then, we add set angles degrees to all gnuplot macros to avoid having to convert from degrees to radians everywhere.

If the operating system is not Windows, we create the **gnuplot** folder if it does not already exist.

```
31 \ifwindows\else
32 \immediate\write18{mkdir -p gnuplot}%
33 \fi
34 \fi
```

bode@style Default axis properties for all plot macros are collected in this pgf style.

```
35 \pgfplotsset{%
    bode@style/.style = {%
36
37
      label style={font=\footnotesize},
38
      tick label style={font=\footnotesize},
39
      grid=both,
40
      major grid style={color=gray!80},
41
      minor grid style={color=gray!20},
      x label style={at={(ticklabel cs:0.5)},anchor=near ticklabel},
42
      y label style={at={(ticklabel cs:0.5)},anchor=near ticklabel},
43
44
      scale only axis,
45
      samples=200,
46
      width=5cm,
    }%
47
48 }
```

3.2 Parametric function generators for poles, zeros, gains, and delays.

```
True, linear, and asymptotic magnitude and phase parametric functions for a pure
        \MagK
               gain G(s) = k + 0i. The macros take two arguments corresponding to real and
  \MagKAsymp
              imaginary part of the gain to facilitate code reuse between delays, gains, poles,
     \MagKLin
               and zeros, but only real gains are supported. The second argument, if supplied, is
         \PhK
    \PhKAsymp
               ignored.
     \PhKLin
               49 \newcommand*{\MagK}[2]{(20*log10(abs(#1)))}
               50 \newcommand*{\MagKAsymp}{\MagK}
               51 \newcommand*{\MagKLin}{\MagK}
               52 \newcommand*{\PhK}[2]{(#1<0?-180:0)}
               53 \newcommand*{\PhKAsymp}{\PhK}
               54 \mbox{ \newcommand*{\PhKLin}{\PhK}}
              True magnitude and phase parametric functions for a pure delay G(s) = e^{-Ts}.
    \PhKAsymp
              The macros take two arguments corresponding to real and imaginary part of the
     \PhKLin
               gain to facilitate code reuse between delays, gains, poles, and zeros, but only real
               gains are supported. The second argument, if supplied, is ignored.
               55 \newcommand*{\MagDel}[2]{0}
               56 \mbox{ } [2]{-#1*180*t/pi}
               These macros are the building blocks for most of the plotting functions provided
     \MagPole
               by this package. We start with Parametric function for the true magnitude of a
\MagPoleAsymp
 \MagPoleLin
              complex pole.
     \PhPole
               57 \newcommand*{\MagPole}[2]
 \PhPoleAsymp
                   {(-20*log10(sqrt(\n@pow{#1}{2} + \n@pow{t - (#2)}{2})))}
   \PhPoleLin
               Parametric function for linear approximation of the magnitude of a complex pole.
               59 \newcommand*{\MagPoleLin}[2]{(t < sqrt(\n@pow{#1}{2} + \n@pow{#2}{2}) ?
                   -20*log10(sqrt(\n@pow{#1}{2} + \n@pow{#2}{2})) :
               61
                   -20*log10(t)
               62
                   )}
               Parametric function for asymptotic approximation of the magnitude of a complex
               pole, same as linear approximation.
               63 \newcommand*{\MagPoleAsymp}{\MagPoleLin}
               Parametric function for the true phase of a complex pole.
               64 \mbox{ } PhPole [2] { (#1 > 0 ? (#2 > 0 ? ) }
                   (\n0\md{-atan2((t - (#2)),-(#1))+360}{360}) :
                   (-atan2((t - (#2)), -(#1)))):
                   (-atan2((t - (#2)),-(#1))))}
               Parametric function for linear approximation of the phase of a complex pole.
               68 \newcommand*{\PhPoleLin}[2]{%
                   (abs(#1)+abs(#2) == 0 ? -90 :
               70
                   (t < (sqrt(\n@pow{#1}{2} + \n@pow{#2}{2}) /
                     71
                   (-atan2(-(#2),-(#1))):
```

```

```

3.3 Second order systems.

Although second order systems can be dealt with using the macros defined so far, the following dedicated macros for second order systems involve less computation.

```
Consider the canonical second order transfer function G(s) = \frac{1}{s^2 + 2\zeta w_n s + w_n^2}. We
    \MagCSPoles
\MagCSPolesAsymp
                  start with true, linear, and asymptotic magnitude plots for this transfer function.
 \MagCSPolesLin
                  90 \newcommand*{\MagCSPoles}[2]{(-20*log10(sqrt(\n@pow{\n@pow{\#2}}{2}))
     \PhCSPoles
                         - \ln(pow{t}{2}){2} + \ln(pow{2*#1*#2*t}{2})))
\PhCSPolesAsymp
                  92 \newcommand*{\MagCSPolesLin}[2]{(t < \#2 ? -40*log10(\#2) : -40*log10(t))}
  \PhCSPolesLin
                  93 \newcommand*{\MagCSPolesAsymp}{\MagCSPolesLin}
    \MagCSZeros
                  Then, we have true, linear, and asymptotic phase plots for the canonical second
\MagCSZerosAsymp
                  order transfer function.
 \MagCSZerosLin
                  94 \mbox{ } (2*(#1)*(#2)*t), (\mbox{ } (2) 
      \PhCSZeros
                      - \n@pow{t}{2})))
\PhCSZerosAsymp
                  96 \newcommand*{\PhCSPolesLin}[2]{(t < (#2 / (\n@pow{10}{abs(#1)})) ?
   \PhCSZerosLin
                  97
                      0:
                      (t \ge (\#2 * (\n@pow{10}{abs(\#1)})) ?
                  98
                      (#1>0 ? -180 : 180) :
                  99
                       (#1>0 ? (-180*(log10(t*(\n@pow{10}{#1})/#2))/(2*#1)) :
                 100
                         (180*(log10(t*(\n@pow{10}{abs(#1)})/#2))/(2*abs(#1))))))
                 102 \newcommand*{\PhCSPolesAsymp}[2]{(#1>0?(t<#2?0:-180):(t<#2?0:180))}
```

Plots of the inverse function $G(s) = s^2 + 2\zeta \omega_n s + \omega_n^2$ are defined to be negative of plots of poles. The 0- is necessary due to a bug in gnuplot (fixed in version 5.4, patchlevel 3).

```
104 \newcommand*{\MagCSZerosLin}{0-\MagCSPolesLin}
                 105 \newcommand*{\MagCSZerosAsymp}{0-\MagCSPolesAsymp}

103 \newcommand*{\MagCSZeros}{0-\MagCSPoles}

\MagSOZerosPeak

\MagSOPolesPeak These macros are used to add a resonant peak to linear and asymptotic plots of general second order poles and zeros. Since the plots are parametric, a separate \draw command is needed to add a vertical arrow.

```
135 \newcommand*{\MagSOPolesPeak}[3][]{%
     \draw[#1,->] (axis cs:{sqrt(abs(#3))},{-20*log10(abs(#3))}) --
136
     (axis cs:{sqrt(abs(#3))},{-20*log10(abs(#3)) -
137
       20*log10(abs(#2/sqrt(abs(#3))))));
138
139 }
140 \newcommand*{\MagSOZerosPeak}[3][]{%
141
     \draw[#1,->] (axis cs:{sqrt(abs(#3))},{20*log10(abs(#3))}) --
     (axis cs:{sqrt(abs(#3))},{20*log10(abs(#3))} +
142
       20*log10(abs(#2/sqrt(abs(#3))))));
143
144 }
```

3.4 Commands for Bode plots

3.4.1 User macros

NBodeZPK This macro takes lists of complex poles and zeros of the form {re,im}, and values of gain and delay as inputs and constructs parametric functions for the Bode magnitude and phase plots. This is done by adding together the parametric functions generated by the macros for individual zeros, poles, gain, and delay, described above. The parametric functions are then plotted in a tikzpicture environment using the \addplot macro. Unless the package is loaded with the option pgf, the parametric functions are evaluated using gnuplot.

```
145 \newcommand{\BodeZPK}[4][approx/true]{%
```

Most of the work is done by the \parse@opt and the \build@ZPK@plot macros, described in the 'Internal macros' section. The former is used to parse the optional arguments and the latter to extract poles, zeros, gain, and delay from the first mandatory argument and to generate macros \func@mag and \func@ph that hold the magnitude and phase parametric functions.

```
146 \parse@opt{#1}%
147 \gdef\func@mag{}%
148 \gdef\func@ph{}%
149 \build@ZPK@plot{\func@mag}{\func@ph}{\opt@approx}{#2}%
```

The \noexpand macros below are needed to so that only the macro \opt@group is expanded.

```
\edef\temp@cmd{\noexpand\begin{tikzpicture}[\unexpanded\expandafter{\opt@tikz}]%
150
151
        \noexpand\begin{groupplot}[%
152
          bode@style,
          xmin={#3},
153
154
          xmax={#4},
         domain=#3:#4,
155
          height=2.5cm,
156
         xmode=log,
157
          group style = {group size = 1 by 2, vertical sep=0.25cm},
158
159
          \opt@group
160
       1%
     }%
161
162
     \temp@cmd
```

To ensure frequency tick marks on magnitude and the phase plots are always aligned, we use the groupplot library. The \expandafter chain below is used to expand macros in the plot and group optional arguments.

```
\if@pgfarg
163
            \expandafter\nextgroupplot\expandafter[ytick distance=20,
164
             ylabel={Gain (dB)},xmajorticks=false,\optmag@axes]
165
            \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\optmag@plot]}%
166
            \temp@cmd {\func@mag};
167
168
            \optmag@commands;
            \expandafter\nextgroupplot\expandafter[ytick distance=45,
169
              \label= \{Phase \ (\$^{\circ})\}, xlabel= \{Frequency \ (rad/s)\}, \ optph@axes]
170
171
            \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\optph@plot]}%
172
            \temp@cmd {\func@ph};
            \optph@commands;
173
174
```

In gnuplot mode, we increment the gnuplot@id counter before every plot to make sure that new and reusable .gnuplot and .table files are generated for every plot.

```
\stepcounter{gnuplot@id}
175
         \expandafter\nextgroupplot\expandafter[ytick distance=20,
176
           ylabel={Gain (dB)},xmajorticks=false,\optmag@axes]
177
          \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\optmag@plot]}%
178
         \temp@cmd gnuplot[gnuplot@degrees,gnuplot@prefix] {\func@mag};
179
         \optmag@commands;
180
         \stepcounter{gnuplot@id}
181
         \expandafter\nextgroupplot\expandafter[ytick distance=45,
182
           ylabel={Phase ($^{\circ}$)},xlabel={Frequency (rad/s)},\optph@axes]
183
184
         \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\optph@plot]}%
         \temp@cmd gnuplot[gnuplot@degrees,gnuplot@prefix] {\func@ph};
185
         \optph@commands;
186
       \fi
187
       \end{groupplot}
188
     \end{tikzpicture}
189
190 }
```

\BodeTF Implementation of this macro is very similar to the \BodeZPK macro above. The only difference is the lack of linear and asymptotic plots and slightly different parsing of the mandatory arguments.

```
191 \newcommand{\BodeTF}[4][]{%
192
     \parse@opt{#1}%
     \gdef\func@mag{}%
193
194
     \gdef\func@ph{}%
     \build@TF@plot{\func@mag}{\func@ph}{#2}%
195
     \edef\temp@cmd{\noexpand\begin{tikzpicture}[\unexpanded\expandafter{\opt@tikz}]%
196
       \noexpand\begin{groupplot}[%
197

234
       \end{groupplot}
     \end{tikzpicture}
235
236 }
```

\addBodeZPKPlots

This macro is designed to issues multiple \addplot macros for the same set of poles, zeros, gain, and delay. All of the work is done by the \build@ZPK@plot macro.

```
237 \newcommand{\addBodeZPKPlots}[3][true/{}]{%
     \foreach \approx/\opt in {#1} {%
238
       \gdef\plot@macro{}%
239
240
       \gdef\temp@macro{}%
       \ifnum\pdfstrcmp{#2}{phase}=0
241
         \build@ZPK@plot{\temp@macro}{\plot@macro}{\approx}{#3}%
242
243
       \else
         \build@ZPK@plot{\plot@macro}{\temp@macro}{\approx}{#3}%
244
       \fi
245
246
       \if@pgfarg
247
         \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\opt]}%
```

```
248  \temp@cmd {\plot@macro};
249  \else
250   \stepcounter{gnuplot@id}%
251   \edef\temp@cmd{\noexpand\addplot[variable=t,thick,\opt]}
252   \temp@cmd gnuplot[gnuplot@degrees,gnuplot@prefix] {\plot@macro};
253  \fi
254  }%
255 }
```

\addBodeTFPlot This macro is designed to issues a single \addplot macros for the set of coefficients and delay. All of the work is done by the \build@TF@plot macro.

```
256 \newcommand{\addBodeTFPlot}[3][thick]{%
     \gdef\plot@macro{}%
257
     \gdef\temp@macro{}%
258
     \ifnum\pdfstrcmp{#2}{phase}=0
259
       \build@TF@plot{\temp@macro}{\plot@macro}{#3}%
260
261
     \else
262
       \build@TF@plot{\plot@macro}{\temp@macro}{#3}%
263
     \fi
264
     \if@pgfarg
       \addplot[variable=t,#1]{\plot@macro};
265
     \else
266
       \stepcounter{gnuplot@id}%
267
       \addplot[variable=t,#1] gnuplot[gnuplot@degrees, gnuplot@prefix] {\plot@macro};
268
269
     \fi
270 }
```

\addBodeComponentPlot

This macro is designed to issue a single \addplot macro capable of plotting linear combinations of the basic components described in Section 2.1.1. The only work to do here is to handle the pgf package option.

```
271 \newcommand{\addBodeComponentPlot}[2][thick]{%
272 \if@pgfarg
273 \addplot[variable=t,#1]{#2};
274 \else
275 \stepcounter{gnuplot@id}%
276 \addplot[variable=t,#1] gnuplot[gnuplot@degrees,gnuplot@prefix] {#2};
277 \fi
278 }
```

BodePlot An environment to host macros that pass parametric functions to \addplot macros. Uses the defaults specified in bode@style to create a shortcut that includes the tikzpicture and semilogaxis environments.

```
279 \newenvironment{BodePlot}[3][]{%
280 \parse@env@opt{#1}%
281 \edef\temp@cmd{\noexpand\begin{tikzpicture}[\unexpanded\expandafter{\opt@tikz}]
282 \noexpand\begin{semilogxaxis}[%
283 bode@style,
284 xmin={#2},
285 xmax={#3},
```

```
domain=#2:#3,
286
          height=2.5cm,
287
          xlabel={Frequency (rad/s)},
288
          \unexpanded\expandafter{\opt@axes}
289
290
       ]%
291
     }%
292
     \temp@cmd
293 }{
        \end{semilogxaxis}
294
      \end{tikzpicture}
295
296 }
```

3.4.2 Internal macros

\add@feature

This is an internal macro to add a basic component (pole, zero, gain, or delay), described using one of the macros in Section 2.1.1 (input #2), to a parametric function stored in a global macro (input #1). The basic component value (input #3) is a complex number of the form {re,im}. If the imaginary part is missing, it is assumed to be zero. Implementation made possible by this StackExchange answer.

```
297 \newcommand*{\add@feature}[3]{%
     \ifcat$\detokenize\expandafter{#1}$%
298
       \xdef#1{\unexpanded\expandafter{#1 0+#2}}%
299
300
301
       \xdef#1{\unexpanded\expandafter{#1+#2}}%
302
     \foreach \y [count=\n] in #3 {%
303
       \xdef#1{\unexpanded\expandafter{#1}{\y}}%
304
       \xdef\Last@LoopValue{\n}%
305
306
     \ifnum\Last@LoopValue=1%
307
       \xdef#1{\unexpanded\expandafter{#1}{0}}%
308
309
     \fi
310 }
```

\build@ZPK@plot

This is an internal macro to build parametric Bode magnitude and phase plots by concatenating basic component (pole, zero, gain, or delay) macros (Section 2.1.1) to global magnitude and phase macros (inputs #1 and #2). The \add@feature macro is used to do the concatenation. The basic component macros are inferred from a feature/{values} list, where feature is one of z,p,k, and d, for zeros, poles, gain, and delay, respectively, and {values} is a comma separated list of comma separated lists (complex numbers of the form {re,im}). If the imaginary part is missing, it is assumed to be zero.

```
311 \newcommand{\build@ZPK@plot}[4]{%
312 \foreach \feature/\values in {#4} {%
313 \ifnum\pdfstrcmp{\feature}{z}=0
314 \foreach \z in \values {%

```

\parse@opt

Parses options supplied to the main Bode macros. A for loop over tuples of the form \obj/\typ/\opt with a long list of nested if-else statements does the job. If the input \obj is plot, axes, group, approx, or tikz the corresponding \opt are passed, unexpanded, to the \addplot macro, the \nextgroupplot macro, the groupplot environment, the \build@ZPK@plot macro, and the tikzpicture environment, respectively. If \obj is commands, the corresponding \opt are stored, unexpanded, in the macros \optph@commands and \optmag@commands, to be executed in appropriate axis environments.

```

3.5 Nyquist plots

3.5.1 User macros

\NyquistZPK

Converts magnitude and phase parametric functions built using \build@ZPK@plot into real part and imaginary part parametric functions. A plot of these is the Nyquist plot. The parametric functions are then plotted in a tikzpicture environment using the \addplot macro. Unless the package is loaded with the option pgf, the parametric functions are evaluated using gnuplot. A large number of samples is typically needed to get a smooth plot because frequencies near 0 result in plot points that are very close to each other. Linear frequency sampling is unnecessarily fine near zero and very coarse for large ω . Logarithmic sampling makes it worse, perhaps inverse logarithmic sampling will help, pull requests to fix that are welcome!

```
511 \newcommand{\NyquistZPK}[4][]{%
     \parse@N@opt{#1}%
512
513
     \gdef\func@mag{}%
     \gdef\func@ph{}%

587
                                                 \n \prop {10}{((\func \prop 
588
589
                           \fi
590 }
```

\addNyquistTFPlot

Adds Nyquist plot of a transfer function in TF form. This macro is designed to pass two parametric function to an \addplot macro. The parametric functions for phase (\func@ph) and magnitude (\func@mag) are built using the \build@TF@plot macro, converted to real and imaginary parts and passed to \addplot commands.

```
591 \newcommand{\addNyquistTFPlot}[2][]{%
592
     \gdef\func@mag{}%
     \gdef\func@ph{}%
593
     \build@TF@plot{\func@mag}{\func@ph}{#2}%
594
595
       \addplot[variable=t,#1] ( {\n@pow{10}{((\func@mag)/20)}*cos(\func@ph)},
596
         {\n@pow{10}{((\func@mag)/20)}*sin(\func@ph)} );
597
598
     \else
599
       \stepcounter{gnuplot@id}%
       \addplot[variable=t,#1] gnuplot[parametric,gnuplot@degrees,gnuplot@prefix]{%
600
         \n @pow{10}{((\func@mag)/20)}*cos(\func@ph),
601
602
         \n \pow{10}{((\func@mag)/20)}*sin(\func@ph)};
     \fi
603
604 }
```

NyquistPlot An environment to host \addNyquist... macros that pass parametric functions to \addplot. Uses the defaults specified in bode@style to create a shortcut that includes the tikzpicture and axis environments.

```
605 \newenvironment{NyquistPlot}[3][]{% 
606 \parse@env@opt{#1}%
```

```
\edef\temp@cmd{\noexpand\begin{tikzpicture}[\unexpanded\expandafter{\opt@tikz}]%
607
        \noexpand\begin{axis}[%
608

Change History

v1.0	\parse@N@opt: Added commands
General: Initial release 1	and tikz options 31
v1.0.1	\parse@env@opt: Added tikz
\BodeZPK: Pass arbitrary TikZ	option to environments 27
commands as options 19	\parse@opt: Added Tikz option . 26
\addBodeZPKPlots: Improved	gnuplot@prefix: Added jobname
optional argument handling 21	to gnuplot prefix
v1.0.2	NicholsChart: Added tikz option
<pre>gnuplot@degrees: Fixed issue #1 15</pre>	to environments
v1.0.3	NyquistPlot: Added tikz option to
\BodeTF: Added Tikz option 20	environments
\BodeZPK: Added Tikz option 19	environments
\NicholsTF: Added commands	v1.0.4
and tikz options 31	General: Fixed unintended
\NicholsZPK: Added commands	optional argument macro
and tikz options 31	expansion 1
\NyquistTF: Added commands	v1.0.5
and tikz options 29	\parse@opt: Fixed a bug 26
\NyquistZPK: Added commands	v1.0.6
and tikz options 28	General: Fixed issue #3 1
